

## 6.2 Greatest Common Factor (GCF)

The greatest common factor (GCF) of two or more numbers is the greatest number that is a factor of all of the numbers.

Another name for the GCF is the greatest common divisor (GCD).

There are two ways to find the GCF: make a list or use prime factorization.

### Make a List

1. List all of the factors (numbers that multiply together) of each number.
2. Find the common factors.
3. Choose the greatest common factor.

Example: Find the GCF of 12 & 20.

12: 1, 2, 3, 4, 6, 12  
20: 1, 2, 4, 5, 10, 20

$GCF = 4$

## Use Prime Factorization

1. Write the prime factorization of each number. You can use a factor tree.
2. Multiply the prime factors that the numbers have in common. The product is the GCF.

Example: Find the GCF of 12 & 20.

Example: Find the GCF of each pair of numbers.

1.) 8 and 10

GCF = 2

2.) 48 and 56

GCF: 8

3.) 45 & 75

45:  $3 \times 3 \times 5$   
 75:  $3 \times 5 \times 5$

GCF:  $3 \times 5 = 15$

**Example:** Find the GCF of each pair of numbers.

4.) 14, 49, 70

$$14: 2 \times 7$$

$$49: 7 \times 7$$

$$70: 2 \times 5 \times 7$$

$$\text{GCF} = 7$$

5.) 22, 66, and 110

$$22: 2 \times 11$$

$$66: 2 \times 3 \times 11$$

$$110: 2 \times 5 \times 11$$

$$\text{GCF} = 2 \times 11 = 22$$

**Example:** Find the pair of numbers that matches the description.

6.) between 10 and 18 that have 4 as their GCF

10 11 12 13 14 15 16 17 18

$12 \text{ \& } 16$

7.) between 15 and 25 that have 8 as their GCF

15 16 17 18 19 20 21 22 23 24 25

$16 \text{ \& } 24$
