

## 1.7 Words, Equations, Tables, and Graphs

You have already seen that a relation may be represented as a set of ordered pairs.

You can also write a rule for the operation(s) performed on the domain value to get the range value.

A table may list the x-coordinates (domain values), the rule, and the y-coordinates (range values).

Example: Make a table for four different domain values & write an algebraic expression for the rule.

"double <sup>x</sup>a number then add three"

X	$2x + 3$	y
2	$2 \cdot 2 + 3 = 4 + 3$	7
5	$2 \cdot 5 + 3 = 10 + 3$	13
7	$2 \cdot 7 + 3 = 14 + 3$	17
9	$2 \cdot 9 + 3 = 18 + 3$	21

State the domain & range of the relation.

Domain: 2, 5, 7, 9

Range: 7, 13, 17, 21

Example: Make a table for four different domain values & write an algebraic expression for the rule.

"double a number, then subtract one"

$x$	$2x - 1$	$y$
3	$2 \cdot 3 - 1 = 6 - 1$	5
7	$2 \cdot 7 - 1 = 14 - 1$	13
10	$2 \cdot 10 - 1 = 20 - 1$	19
12	$2 \cdot 12 - 1 = 24 - 1$	23

State the domain & range of the relation.

Domain: 3, 7, 10, 12

Range: 5, 13, 19, 23

Example: Make a table for four different domain values & write an algebraic expression for the rule.

The team scores 6 points for each touchdown

$x$	$x \cdot 6$ or $6x$	$y$
4	$6 \cdot 4$	24
8	$6 \cdot 8$	48
16	$6 \cdot 16$	96
20	$6 \cdot 20$	120

State the domain & range of the relation.

Domain: 4, 8, 16, 20

Range: 24, 48, 96, 120

Example: Make a table for four different domain values & write an algebraic expression for the rule.

Bob spent 5 more than 3 times what Anna spent

$x$	$3x + 5$	$y$
3	$3 \cdot 3 + 5 = 9 + 5$	14
9	$3 \cdot 9 + 5 = 27 + 5$	32
14	$3 \cdot 14 + 5 = 42 + 5$	47
24	$3 \cdot 24 + 5 = 72 + 5$	77

State the domain & range of the relation.

D: 3, 9, 14, 24

R: 14, 32, 47, 77

Words, equations, tables, and graphs can be used to represent relations.

An EQUATION is a mathematical sentence stating that two quantities are equal.

Relations are often written as equations with two variables - one to represent domain values and one to represent range values.

Example: An assembly line produces 30 boxes per hour.

- a.) Write an equation to find the amount of boxes it can produce for any number of hours.

$$y = 30x$$

- b.) Make a table for 5, 10, 15, and 20 hours of production.

$x$	$y = 30x$	$y$
5	$30 \cdot 5$	150
10	$30 \cdot 10$	300
15	$30 \cdot 15$	450
20	$30 \cdot 20$	600

Example: The navigation message from a satellite to a GPS in an airplane is sent once every 12 minutes.

- a.) Write an equation to find the number of messages sent in any number of minutes.

$$y = x \div 12$$

- b.) Make a table to find the number of messages in 120, 180, 240, and 300 minutes.

$x$	$y = x \div 12$	$y$
120	$120 \div 12$	10
180	$180 \div 12$	15
240	$240 \div 12$	20
300	$300 \div 12$	25
